**ABSTRACT**

Antimicrobial efficiency of *Jasminum sambac* aromatic plants leaf extracts were examined using petroleum ether, chloroform, ethyl acetate and ethanol as solvents and tested against eight human pathogens like Bacteria: *Bacillus subtilis*, *Bacillus cereus*, *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, Fungi: *Aspergillus niger*, *Aspergillus flavus*, *Candida albicans* using agar disc diffusion method. The ethanol extracts of *Jasminum sambac* showed highest antibacterial activity against than that moderate the ethyl acetate, petroleum ether and chloroform the bacterial strains tested. The mean zone of inhibition produced by the extracts in disc diffusion assays were ranged from 5 mm to 27 mm. All the plants showed significant activity against all pathogens. The minimum zone of inhibition and comparatively greater inhibitory concentration were determined in petroleum ether and chloroform extract of *Jasminum sambac* showing less antimicrobial activity against all the experimental strains. The preliminary phytochemical analysis of presence and absence of different solvent extracts of Alkaloid, Flavonoid, tannin, Saponin, glycoside, steroid and terpinoid. The Spectrum of activity observed in the present study may be indicative of the present study ethnolic extracts of these plants could be a possible source to obtained new and effective herbal medicines to treat infections, hence justified the tribal uses of *Jasminum sambac* against various infectious diseases.

**Key words:** Antimicrobial activity, *Jasminum sambac* Linn. Agar Disc diffusion method, Minimum Inhibitory Concentration

**INTRODUCTION**

Many of the plant materials used in traditional medicine are readily available in rural areas. Medicinal plants are valuable source of natural active constituents that are used to maintain human health and also used for the treatment of many human diseases. Plants are good source of economically important compounds such as phenolic compounds, nitrogen containing compounds, vitamins and minerals which have anti-oxidant, anti-tumor, anti-mutagenic, anti-carcinogenic and diuretic activities. In Indian traditional medicine, herbs are used as beautification of the body and for preparation of various cosmetics and colours. Nature has been a source of medicinal plants for thousands of years and an impresive number of modern drugs have been isolated from natural sources. Various medicinal plants have been used for years in daily life to treat various diseases all over the world. The medicinal plants have always played a key role in the maintenance of world health by providing the best source of remedies for a variety of ailments. Infectious diseases are the leading cause of death and disabilities worldwide. Food-borne infections have been one of the major public health concerns and they account for considerably high cases of illness. The numbers of invasive fungal and bacterial infections have dramatically increased in both developed and developing countries. Therefore researchers are increasingly turning their attention to folk medicine, looking for new leads to develop better drugs against microbial infection. The increasing failure of chemotherapeutics and antibiotic resistance exhibited by pathogenic microbial infectious agents has led to the screening of several medicinal plants for their potential antimicrobial activity. Multiple drug resistance in both human and plant pathogens has developed due to the indiscriminate use of commercial antimicrobial drugs commonly used in the treatment of infectious diseases. The limited life span of antibiotics has rendered a necessity to search for new antimicrobial substances from various sources such as medicinal plants. Antibiotic resistance has...
MATERIALS AND METHODS

Collection of Plant Material
The fresh leaves of *Jasminum sambac* were collected from Villupuram District, Alagramam Village (Latitude 12° 10' 0.6060" N and Longitude 79° 34' 12.6372" E) TamilNadu, India. Deposited in the Herbarium of Department of Botany, (AUBOT 278). Annamalai University, Annamalai Nagar.

Extraction of Leaves of *Jasminum Sambac* in Different Solvents
The collected plant Material was washed with water to remove other undesirable material and dried under shade. The air-dried leaves (500 gm) of *Jasminum sambac* were Crushed. The crushed leaves extracted with different solvents of increasing polarity viz. Petroleum ether, Chloroform, Ethyl acetate and Ethanol by hot percolation method using Soxhlet Apparatus.

Phytochemical Analysis of Different Extracts
The different extracts of leaves of *Jasminum sambac* were tested for various Components as follows.

1. Test for alkaloids

Small portion of solvent free extract was stirred with few drops of dil HCl and filtered. The filtrate was then tested for following colour test

**Mayer's test**
(a) 1.36 gm of mercuric chloride was dissolved in 60 ml distilled water. (b) 5gms of potassium iodide was dissolved in20 ml of distilled water.(a) and (b) was mixed and the volume adjusted to 100ml with distilled water. Appearance of cream colour precipitate with Mayer’s reagents showed the presence of alkaloids.

2. Test for flavonoids

**Shinoda’s test**
5 ml of 20% sodium hydroxide was added to equal volume of the sample extract. A yellow solution indicates the presence of flavonoids.

3. Test for tannins and phenolic compounds

10% lead acetate solution, 0.5g of the extract was added and shanken to dissolved. A white precipitate observed indicate the presence of tannins and phenolic compounds.

4. Detection for carbohydrates and glycosides

**Molisch’s test**
10 gm of alpha naphthol was dissolved in 100 ml of 95% alcohol. Extract was treated with this solution and 0.2 ml of the test tube, purple or violet colour appeared at the junction.

**Fehling’s Test**
6.932 gm of copper sulphate was dissolved in distilled water. (a) and (b) was mixed and stirred with few drops of dil HCl and filtered. The filtrate was then tested for following colour test

5. Test for sterols and terpenoids

**Salkowski test**
Small portion of solvent free extract was stirred with few drops of dil HCl and filtered. The filtrate was then tested for following colour test

**Mayer’s test**
(a) 1.36 gm of mercuric chloride was dissolved in 60 ml distilled water. (b) 5gms of potassium iodide was dissolved in20 ml of distilled water.(a) and (b) was mixed and the volume adjusted to 100ml with distilled water. Appearance of cream colour precipitate with Mayer’s reagents showed the presence of alkaloids.

2. Test for flavonoids

**Shinoda’s test**
5 ml of 20% sodium hydroxide was added to equal volume of the sample extract. A yellow solution indicates the presence of flavonoids.

3. Test for tannins and phenolic compounds

10% lead acetate solution, 0.5g of the extract was added and shanken to dissolved. A white precipitate observed indicate the presence of tannins and phenolic compounds.

4. Detection for carbohydrates and glycosides

**Molisch’s test**
10 gm of alpha naphthol was dissolved in 100 ml of 95% alcohol. Extract was treated with this solution and 0.2 ml of the test tube, purple or violet colour appeared at the junction.

**Fehling’s Test**
6.932 gm of copper sulphate was dissolved in distilled water and make volume up to 100 ml (solution A). 34.6 gm of potassium sodium tartarate and 10 gm of sodium hydroxide was dissolved in distilled water and make volume up to 100 ml (solution B). Two solution was mixed in equal volume prior to use and few drop of sample was added and boiled, a brick red precipitate of cuprous oxide was formed, if reducing sugars were present.

5. Test for sterols and terpenoids

**Salkowski test**
Extract was treated with few drops of conc. Sulphuric acid , shake well and allowed to stand for some time, red colour appear at the lower layer indicated the presence of steroids and formation of yellow collared lower layer indicated the presence of terpenoids.

6. Test for proteins and amino acids

**Ninhydrin test**
1gm of ninhydrin (indane1, 2, 3 trione hydrate) was dissolved in n-butanol and make the volume to 100ml. Extract treated with this solution gave violet colour on boiling.

7. Test for Saponin

**Foam test**
1ml of extract was diluted with distilled water to 20ml and shake in a graduated cylinder for 15 minutes. A one centimetre layer of foam indicated the presence of Saponin.
8. Test for gums and mucillages
About 10ml of various extracts were treated with absolute alcohol and filtered. Occurrence of precipitate indicates the presence of gum and mucilage’s.

9. Test for fats and fixed oil
Spot test
Small quantity of the extract is placed between two filter papers. Oil stains produced with any extract shows the presence of fixed oils and fats in the extract.

Collection of Bacterial Strains
The antibacterial activity was tested using leaf extracts from each individual against two strains of gram positive bacteria viz., Bacillus subtilis (MTCC 10224), Bacillus cereus (MTCC 10211), Staphylococcus aureus (MTCC 9542), gram negative bacteria viz., Escherichia coli (MTCC 1563), Pseudomonas aeruginosa (MTCC 14676), were procured from Microbial Type Culture Collection (MTCC), Chandigarh. The Clinical isolates of fungal strains viz Aspergillus niger, Aspergillus flavus and Candida albicans were obtained from the Department of Microbiology, Rajah Muthiah Medical College and Hospital, Annamalai University, Annamalai Nagar, Tamil Nadu, India. These strains were maintained on nutrient agar slant at 4 °C. In vitro antibacterial activity was determined by using Muller Hinton Agar (MHA) and Muller Hinton Broth (MHB) was obtained from Hi media, Mumbai.

Antibiotic Sensitivity Test
Antibiotic sensitivity of the bacterial strains were determined by standard CLSI disc diffusion method (M100-S22, 2012). Antibacterial agents from different classes of antibiotics viz., Methicillin (ME 5 µg/disc), Oxacillin (OX 50 µg/disc), Linezolid (LIN 30 µg/disc), Vancomycin (VAN 30 µg/disc), Amikacin (AK 30 µg/disc), Ampicillin (AMP 10 µg/disc), Cefixime (CFM 5 µg/disc), Ceftazidime (CAZ 30 µg/disc), Ciprofloxacin (CIP 5 µg/disc), Chloramphenicol (C 30 µg/disc), Erythromycin (E 15 µg/disc), Gentamycin (GEN 10 µg/disc), Norfloxacin (NX 10 µg/disc), Nalidixic acid (NA 30 µg/disc), Ofloxacin (OF 5 µg/disc), Streptomycin (S 10 µg/disc) and Tetracycline (TE 30 µg/disc), were obtained from Himedia, Mumbai.

Preparation of Test Solution and Disc
The test solution was prepared with known weight of crude extracts, dissolved in 5 percent of Dimethyl sulphoxide (DMSO). Whatman no:1 sterile filter paper discs (6mm) were impregnated with 20µl of the extract allowed to dry at room temperature.

Antibacterial and Antifungal Assay
Disc Diffusion Method
The agar diffusion method17 was followed for antibacterial susceptibility test. Petri plates were prepared by pouring 20ml Mueller Hinton Agar and Saborourud Dextrose Broth allowed to solidity for the use in susceptibility test against bacteria and fungi. Plates were dried and 0.1ml of standardized inoculums suspension was poured and uniformly spread. The excess inoculums were drained and the plates were allowed to dry for 5 minutes. After drying the discs with extract were placed on the surface of the plates with sterile forceps and gently pressed to ensure the content with the inoculated agar surface. Ciprofloxacin (5µg/disc) for bacteria and Amphotericin-B (100units/disc) was used as positive control. 5 percent DMSO was used as blind control in these assays. Finally the inoculated plates were incubated at 37°C for 24h (bacterial) and 28°C for 24-72 hours (fungi). The zone of inhibition was observed and measured in millimetres. Each assay in this experiment was repeated three times.

Measurement of Bio Assay
For the present in vitro experiment 3 replicates were maintained. After 24 to 72 hours incubation the diameter of inhibition zone was measured for the edge of the disc to the inner margin of the surrounding pathogens.

Statistical Analysis
The results were expressed as the mean ± SD. All statistical analyses were performed using SPSS version 16.0 statistical software (SPSS Inc., Chicago, IL, USA). Student’s t-test was performed to determine any significant difference between different extracts for in vitro antibacterial assays. Comparison of means for in vitro antibacterial assessment was carried out using one-way analysis of variance (ANOVA) and Duncan test. P value < 0.05 was considered statistically significant.

RESULTS
Phytochemical Screening
The colour, nature and the total yield of each extract obtained from different solvents are presented in (Table:1). Phytochemical evaluation of the various extracts from of the leaf of Jasminum sambac were done for the presence Alkaloids, Flavonoids, Saponin, Tannin, Phenol, Terpenoid, Glycoside, Steroids the results are presented in(Table:2)

Antimicrobial Activity

The antimicrobial activity was examined by agar well diffusion method. The petroleum ether, chloroform, ethyl acetate and ethanol extract from *Jasminum sambac* leaf exhibited potent antimicrobial activity towards all the microbes. The zone of inhibition values are presented in (Table: 3; Figure: 1 and Plate: 1). *Bacillus cereus* was found to be more highest activity towards the ethanol extract from the leaf with maximum inhibitory zone (22mm) followed by ethyl acetate (23mm), chloroform (18mm) and Petroleum ether (20mm). *Bacillus subtilis* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (22mm) followed by Ethyl acetate (20mm), Petroleum ether (18.4mm) and Chloroform (16mm). *Staphylococcus aureus* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (20mm) followed by ethyl acetate (19mm), petroleum ether (17mm) and chloroform (16mm). *Escherichia coli* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (15mm) followed by ethyl acetate (13mm), petroleum ether (12mm) and chloroform (10mm). *Pseudomonas aeruginosa* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (13mm) followed by ethyl acetate (12mm), petroleum ether (10.5mm) and chloroform (9.5mm). *Candida albicans* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (10.5mm) followed by ethyl acetate (9mm), petroleum ether (9mm) and chloroform (8.5mm). *Aspergillus niger* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (10mm) followed by ethyl acetate (9mm), petroleum ether (8.6mm) and chloroform (7.5mm). *Aspergillus flavus* was found to be more higher activity towards the ethanol extract from the leaf with maximum inhibitory zone (9mm) followed by ethyl acetate (8.5mm), petroleum ether (8mm) and chloroform (7.5mm). The result obtained shown that all the extracts showed very significant antimicrobial activity against the tested organisms.

Figure :1 Activation index against various microorganisms.
Plate:1 Antimicrobial activity of ethanolic extracts of *Jasminum sambac L.*

**DISCUSSION**

The extract of leaves of *Jasminum sambac* undergoes various qualitative chemical tests. It was found out that methanol extract was the richest extract for phytoconstituents. It contained all tested phytoconstituents viz. Alkaloids, flavanoids, carbohydrate, phenolic compounds, saponin, glycosides, terpenoids and tannins. Chloroform extract showed the presence of steroids and glycosides compounds while Petroleum ether contained alkaloids and saponins compounds. All extracts showed antibacterial activity. Ethanol extract showed maximum anti-bacterial activity in comparison to other extracts. All extracts showed anti-fungal activity against bacterial culture at a concentration of 150 mg/ml. Ethanol extract showed the maximum anti-fungal activity in comparison to other extracts.

**Antimicrobial activity** using ethanol extract of *Jasminum sambac* (L.) Ait was tested against an array of Gram +ve, (Staphylococcus aureus, methicillin resistant Staphylococcus aureus (MRSA), Bacillus subtilis and Bacillus cereus) Gram –ve bacteria (Escherichia coli, Klebsiella pneumoniae, Salmonella typhimurium, Pseudomonas aeruginosa and Chromobacterium violaceum) filamentous fungi Aspergillus niger, Aspergillus fumigatus, Candida albicans and Candida glabrata and yeasts. In addition, their antipathogenic potential was checked by examining the antiquorum sensing activity of such extracts using Chromobacterium violaceum assays. Ethanol extracts of the callus of *J. sambac* exhibited antibacterial activity against both Gram +ve *S. Aureus* and Gram -ve *S. typhi* and *P. mirabilis*. *Jasminum sambac* (flowers and leaves) extracts were very active (>15 mm inhibition zone) against Gram +ve methicillin resistant *S. aureus*, *B. subtilis*, as well as against Gram -ve *E. coli*, *S. typhimurium* and *K. pneumoniae* and fungi, including the filamentous *A. niger*, *A. fumigates*, and the yeasts *Candida albicans* and *Candida glabrata*.

**Antifungal activity** using methanol extract of *Jasminum grandiflorum*, *Jasminum sambac* (L.) Ait was evaluated using disc diffusion method for the inhibition of fungal growth and spore formation. *Alternaria sp*, *Alternaria sp*, *Aspergillus Niger*, *A. flavus*, *A. fumigatus* and *Curvularia species* are the most prevalent fungi causing nail infection in human beings. Methanol extract of *Jasminum grandiflorum* and *Jasminum sambac* proved to be active against *Alternaria sp*.

**Antibacterial activity** using ethanol extract of *J. sambac* (L.) Ait plant was evaluated against the following 3 strains: *Proteus mirabilis*, *Staphylococcus albus*, and *Salmonella typhi* and was found to be active against all the tested strains.

**Antimicrobial activity** using ethanol extract of *Jasminum sambac* Ait. (Oleaceae) leaves, flowers, fruits and stem bark was evaluated against nine bacteria and four fungi using Agar diffusion assay and Minimum Inhibitory Concentration (MIC) determinations. Study shows that flowers and leaves extracts of *Jasminum sambac* exhibited almost good activity (10-15mm inhibition zone) against Gram +ve bacteria including the Methicillin resistant *Staphylococcus aureus* (MRSA) and *Bacillus subtilis* while a moderate activity was recorded against Gram -ve bacteria including *Escherichia coli* and *Klebsiella pneumonia*.
CONCLUSION
From the above study it is concluded that the ethanol extract showed the maximum antimicrobial activity in comparison to other extracts. The antimicrobial activity of *Jasminum sambac* was found active against *Escherichia coli*, *Bacillus subtilis*, *Bacillus Cereus*, *Pseudomonas aeruginosa* in ethyl acetate and petroleum ether extracts whereas extracts of chloroform was found inactive against *Escherichia coli*, and *Pseudomonas*. The extract of ethanol was found highly active against *Candida albicans* and *Aspergillus niger*. The extract of ethyl acetate ether also showed activity against these fungi. It may be concluded that further research need to be done to apply antimicrobial property of *Jasminum sambac* for drugs formulation.
